1. Executive Summary

Satya Stores is a custom-built, mobile-first e-commerce web application for selling mobile phones, electronic accessories, laptops, televisions, and home appliances. The platform consists of a customer storefront and a single-owner administration portal. The owner must be able to manage routine store operations without developer intervention.

1.1 Confirmed Business Decisions

Area	Confirmed decision
Payment	Manual bank/UPI payment verification
Delivery	Delivery arrangements managed manually
Customer authentication	Mobile OTP and email/password
Admin access	One store owner
Inventory	Hybrid: automatic and manual stock management
Business entity	Vasavi Enterprises
Development partner	TECKSODO Solutions
Platform	Mobile-first responsive web application

2. Product Vision and Objectives

Build a centralized e-commerce platform that enables customers to purchase electronics conveniently while allowing the store owner to independently manage products, pricing, inventory, customers, payments, orders, delivery updates, and website content.

- Provide a professional, mobile-first shopping experience.
- Support customer registration and secure authentication.
- Provide configurable product categories, variants, search, and filtering.
- Support cart, checkout, and manual bank/UPI payment submission.
- Require owner-side verification before treating a payment as verified.
- Support manual delivery coordination and customer-visible status updates.
- Provide complete customer order histories and owner-side customer records.
- Combine automatic inventory updates with manual stock adjustments.
- Eliminate developer dependency for routine store operations.

2.1 Success Criteria

- Customers can register, browse, place orders, submit payment references, and view order history.
- The owner can manage products, categories, customers, inventory, payment verification, orders, and delivery statuses.
- Inventory is protected against overselling during concurrent checkout.
- Historical order details remain intact when catalogue products are edited or archived.
- All important owner actions are auditable.

3. Business Context and User Roles

3.1 Business Information

Attribute	Details
Store name	Satya Stores
Business entity	Vasavi Enterprises
Development partner	TECKSODO Solutions
Business model	Online retail / B2C
Product focus	Electronics, mobile devices, accessories, and appliances
Primary channel	E-commerce website

3.2 User Roles

Customer: can register, browse products, maintain a cart, place orders, submit payment details, manage permitted profile information, and view order history and delivery status.

Store owner: the only administrative user in the initial release. Has complete access to product, category, inventory, customer, order, payment verification, delivery, promotion, content, and reporting functions. No staff accounts or additional administrator roles are included initially.

4. Product Scope

4.1 Included in Initial Release

- Customer storefront and single-owner administration portal.
- Mobile OTP and email/password authentication.
- Customer profile and delivery address management.
- Product catalogue, categories, subcategories, variants, images, specifications, and SKU management.
- Product search, filtering, and sorting.
- Shopping cart and checkout.
- Manual bank/UPI payment instructions and payment-reference submission.
- Owner-side payment verification and rejection workflow.
- Order management, cancellation handling, and customer order history.
- Manual delivery coordination and status updates.
- Hybrid inventory management with stock reservations and manual adjustments.
- Promotional banners, featured products, and basic content management.
- About, contact, terms, privacy, refund, cancellation, and delivery policy pages.
- Basic operational reporting and audit logs.

4.2 Excluded from Initial Release

- Integrated payment gateway processing.
- Automated courier APIs, shipping labels, and real-time courier tracking.
- Multiple administrative accounts or staff roles.
- Multi-vendor marketplace functionality.
- Native Android or iOS applications.
- Advanced warehouse management, ERP, or accounting integration.
- Loyalty programmes and AI-based recommendations.

5. Product Catalogue and Categories

The initial catalogue must support the following configurable categories and subcategories:

- Mobiles: smartphones, brands and models, RAM/storage variants, and colour variants.
- Home appliances: mixer grinders, induction stoves, kitchen appliances, and other household electrical products.
- Laptops: personal and business laptops, laptop accessories, adapters, and ports.
- Televisions: smart TVs, screen sizes, brands, and models.
- Accessories: mobile chargers, adapters, USB/data cables, connectors, digital watches, smartwatches, and other electronic accessories.

Categories and subcategories must be managed dynamically through the owner dashboard. The owner must not need source-code changes to add or reorganize categories.

6. Customer-Facing Application

6.1 Home Page

- Satya Stores branding and navigation.
- Search bar and category navigation.
- Promotional banners.
- Featured products, latest arrivals, best sellers, and discounted products.
- Footer navigation and policy links.

Product and promotional sections must retrieve their data from the backend. The owner must be able to update banners and featured products without source-code changes.

6.2 Product Listing and Search

- Browse by category and subcategory.
- Search by product name, brand, or SKU.
- Filter by brand, price, and availability.
- Sort by price and newest.
- View product images, MRP, selling price, discount, and stock status.

6.3 Product Details

- Product name, SKU, brand, category, and description.
- Multiple product images.
- MRP, selling price, and discount information.
- Stock availability.
- Technical specifications and warranty details.
- Variants such as colour, RAM, or storage.
- Quantity selection.

Customers must not be able to purchase unavailable stock. Price and stock must be revalidated by the backend at checkout.

6.4 Customer Authentication

The application must support both mobile OTP and email/password authentication.

Mobile OTP workflow

1. Customer enters a mobile number.
2. Backend requests an OTP through an approved SMS provider.
3. Customer receives and submits the OTP.
4. Backend validates the OTP and creates or authenticates the customer account.

5. A secure session is issued.

OTP controls must include expiration, resend restrictions, attempt limits, rate limiting, and mobile number validation. The SMS provider and associated costs require approval.

Email/password workflow

- Registration fields: full name, email, mobile number, password, and password confirmation.
- Email validation and duplicate-account prevention.
- Secure password hashing.
- Login, logout, password recovery, and session management.
- Optional email verification.

Both methods must resolve to the same customer account only when a verified identifier matches an existing account under an explicit account-linking policy. Accounts must not be merged using unverified information.

6.5 Customer Profile

- View and update permitted personal details.
- Manage delivery addresses.
- Change password.
- View orders, payment status, current orders, and cancelled orders.

6.6 Shopping Cart

- Add and remove products.
- Update quantities and variants.
- Calculate subtotal, discounts, delivery charges, and final amount.
- Persist the logged-in customer's cart between sessions.

The backend must recalculate prices and validate stock during checkout; client-side totals are not authoritative.

6.7 Checkout

1. Customer reviews the cart.
2. Customer selects a delivery address.
3. Backend validates availability and current prices.
4. Backend calculates the order total.
5. Customer selects manual bank/UPI payment.
6. Application displays payment instructions and the amount payable.
7. Customer transfers funds outside the application.
8. Customer submits payment reference and supporting details.
9. Order enters payment verification.
10. Customer sees that payment submission is awaiting verification.

The system must generate a unique order number and preserve an immutable snapshot of the items, prices, and delivery address associated with the order.

7. Manual Bank/UPI Payment Management

The initial release will not use an integrated payment gateway. Customers transfer funds through the business-approved bank or UPI account and submit payment information for owner verification.

7.1 Customer Payment Interface

- Payment recipient name.
- UPI ID and/or bank account details.
- Payment instructions and order reference.

- Amount payable.
- Payment submission form.

The owner must be able to configure payment instructions in the dashboard. The interface must clearly state that submitting a payment reference does not mean the payment has been verified.

7.2 Payment Submission Fields

- Order ID.
- Payment method.
- Transaction reference / UTR.
- Transaction date.
- Amount transferred.
- Optional payment screenshot.

7.3 Owner Verification

- Display order and customer details, expected amount, submitted method, UTR/reference, transaction date, screenshot, and submission timestamp.
- Allow the owner to mark payment as verified, reject it, or request additional information.
- Require a rejection reason when rejecting a payment.
- Record each decision with timestamp and administrator identity.

7.4 Payment Statuses

- Awaiting Payment.
- Payment Details Submitted.
- Verification Pending.
- Verified.
- Rejected.
- Refund Pending.
- Refunded.

7.5 Payment Security

- Never store UPI PINs, banking passwords, OTPs, or card credentials.
- Restrict access to payment evidence.
- Validate uploaded file types and sizes.
- Store payment references securely and log verification decisions.
- A screenshot alone is not proof of successful settlement; the owner must verify the actual bank/UPI transaction.

8. Manual Delivery Management

Delivery arrangements will be coordinated manually by the business. Courier API integration is not required in the initial release.

8.1 Delivery Workflow

1. Customer places an order and submits payment information.
2. Owner verifies payment.
3. Owner confirms and processes the order.
4. Owner arranges delivery outside the application.
5. Owner updates delivery status.
6. Owner marks the order delivered after fulfilment.

8.2 Owner Delivery Information

- Customer name and mobile number.
- Delivery address and instructions.
- Order ID and ordered products.
- Payment status.
- Current delivery status and optional manual delivery reference.

8.3 Delivery Statuses

- Not Arranged.
- Preparing for Dispatch.
- Ready for Dispatch.
- Dispatched.
- Delivered.
- Delivery Attempt Failed.
- Cancelled.

Customers can view the latest status entered by the owner. The application must not imply real-time courier tracking without an integration.

9. Hybrid Inventory Management

Inventory combines automatic system updates with manual owner adjustments.

9.1 Automatic Inventory

- Validate stock during checkout.
- Prevent overselling, including concurrent checkout attempts.
- Reserve or deduct stock according to the configured order policy.
- Finalize stock deduction after the applicable payment/order event.
- Release reservations for eligible cancellations or rejected payments.
- Maintain inventory movement history.

Recommended policy: reserve stock when an order is created; finalize the deduction after payment verification; release the reservation if payment is rejected or the order is cancelled before confirmation. Unpaid reservations must expire according to a configurable policy. The reservation expiry duration requires confirmation.

9.2 Manual Inventory

- Increase or decrease stock.
- Correct stock discrepancies.
- Mark products out of stock.
- Update stock after physical purchases or sales.
- View stock movement history.

Every manual adjustment must record previous quantity, new quantity, adjustment amount, reason, date/time, and the owner identity.

9.3 Inventory Dashboard

- Product name and SKU.
- Available and reserved stock.
- Low-stock and out-of-stock status.
- Last stock update.
- Configurable low-stock thresholds.

10. Owner Administration Dashboard

10.1 Dashboard Overview

- Total customers and products.
- Active and inactive products.
- Total, pending, cancelled, and completed orders.
- Payments awaiting verification and verified payments.
- Sales based on verified payment records.
- Low-stock products and recent orders/customers.

10.2 Product Management

- Add, edit, archive, activate, and deactivate products.
- Upload multiple product images.
- Configure SKU, category, variants, specifications, MRP, selling price, and discounts.
- Update stock and search/filter by SKU, name, category, or status.
- Import products through CSV, subject to validation.

Publication workflow: Draft → Active → Publicly Visible. The single owner can publish directly; developer approval is not required.

10.3 Category Management

- Add/edit categories and subcategories.
- Upload category images.
- Change display order.
- Activate and deactivate categories.

10.4 Customer Management

- View and search registered customers.
- View contact information and registration date.
- View customer orders, cancellations, and verified purchase totals.
- Suspend or reactivate accounts.

10.5 Order Management

- View, search, and filter orders.
- View order details and immutable item snapshots.
- Verify/reject payment and handle eligible cancellation requests.
- Update order status and delivery status.
- Add internal notes.

10.6 Promotions and Content

- Upload and schedule banners.
- Set banner destination links and campaign dates.
- Select featured products.
- Edit About Us, Contact Us, Terms and Conditions, Privacy Policy, Refund Policy, Cancellation Policy, and Shipping/Delivery Policy.

11. Order Lifecycle and State Management

Recommended order lifecycle: Order Created → Awaiting Payment → Payment Details Submitted → Verification Pending → Payment Verified → Order Confirmed → Processing → Preparing for Dispatch → Dispatched → Delivered.

Alternative terminal or exception states: Payment Rejected, Cancellation Requested, Cancelled, Refund Pending, and Refunded.

Payment status, order status, delivery status, and inventory status must be separate fields/state machines. Payment verification must not automatically imply fulfilment or delivery completion.

12. Website Pages

12.1 Customer-Facing Pages

- Home; All Products; Category Listing; Product Details; Search Results.
- Cart; Checkout; Payment Instructions; Payment Submission.
- Login; Registration; Password Recovery.
- Customer Dashboard; Profile; Address Book; My Orders; Order Details; Order Tracking; Cancelled Orders.
- About Us; Contact Us; Terms and Conditions; Privacy Policy; Refund Policy; Cancellation Policy; Shipping Policy.

12.2 Owner Dashboard Pages

- Owner Login; Dashboard Overview; Product Management; Add/Edit Product.
- Category Management; Inventory Management; Customer Management.
- Order Management; Order Details; Payment Verification; Delivery Management.
- Banner Management; Content Management; Reports; Store Settings.

13. Technical Architecture

13.1 Recommended Technology Stack

Layer	Technology
Frontend	Next.js + React
Styling	Tailwind CSS
UI components	shadcn/ui
Backend	Node.js + Express.js
Database	MongoDB
ODM	Mongoose
Authentication	Secure sessions or JWT with refresh-token rotation
OTP provider	Approved SMS provider
Image storage	Cloudinary or S3-compatible object storage
API	REST API
Frontend hosting	Vercel or equivalent
Backend hosting	Managed Node.js hosting or VPS

13.2 Architecture Components

- Customer frontend and owner dashboard.
- Backend API and authentication service.
- OTP verification service.
- Product, category, cart, and checkout services.
- Order and manual payment verification services.
- Inventory and delivery management services.
- Customer, promotion, and content management services.
- MongoDB database and image/object storage.

13.3 Architecture Rules

- Customer and owner interfaces use the same backend.
- Backend enforces all business rules; client-side checks are supplementary only.
- Customer accounts must never receive administrative privileges.
- Only the owner can perform administrative operations and payment verification.
- Inventory operations must be concurrency-safe and transactionally consistent.
- Historical order snapshots must survive catalogue edits and archival.

14. Database Requirements

Initial MongoDB collections and principal fields:

Collection	Principal fields
User	userId, fullName, email, mobileNumber, passwordHash, mobileVerified, emailVerified, accountStatus, role, createdAt, updatedAt
Address	addressId, userId, recipientName, mobileNumber, addressLine1, addressLine2, city, state, postalCode, country, isDefault
Product	productId, productName, SKU, brand, categoryId, description, images, MRP, sellingPrice, stockQuantity, reservedQuantity, lowStockThreshold, specifications, warranty, variants, publicationStatus, deletedAt
Category	categoryId, name, slug, description, image, parentCategoryId, displayOrder, status
Cart	cartId, userId, items, quantities, variants, updatedAt
Order	orderId, orderNumber, userId, itemsSnapshot, shippingAddressSnapshot, subtotal, discount, shippingCharge, tax, totalAmount, orderStatus, paymentStatus, deliveryStatus
Payment	paymentId, orderId, userId, paymentMethod, paymentReference, transactionDate, amount, evidenceFile, verificationStatus, verifiedBy, verifiedAt, rejectionReason, refundStatus
InventoryMovement	movementId, productId, movementType, quantity, previousQuantity, newQuantity, reason, relatedOrderId, performedBy, createdAt
Delivery	deliveryId, orderId, deliveryStatus, deliveryAddressSnapshot, deliveryInstructions, manualReference, deliveryNotes, updatedBy, updatedAt
Promotion	promotionId, title, description, image, destinationUrl, startDate, endDate, status
ContentPage	pageId, title, slug, content, publicationStatus, updatedAt
AuditLog	logId, administratorId, action, entityType, entityId, previousValue, newValue, timestamp
OTPVerification	verificationId, mobileNumber, OTP hash, expiryTime, attempts, verifiedAt, createdAt

OTP values must be short-lived and stored as hashes rather than readable plaintext. Apply appropriate indexes, uniqueness constraints, retention policies, and access controls.

15. API Requirements

Module	Endpoint
Registration	POST /api/v1/auth/register
Email login	POST /api/v1/auth/login
OTP request	POST /api/v1/auth/otp/request
OTP verification	POST /api/v1/auth/otp/verify
Logout	POST /api/v1/auth/logout
Customer profile	GET /api/v1/customers/me
Product listing	GET /api/v1/products
Product details	GET /api/v1/products/:id
Admin product creation	POST /api/v1/admin/products
Admin product update	PATCH /api/v1/admin/products/:id
Admin product archive	DELETE /api/v1/admin/products/:id
Categories	GET /api/v1/categories
Cart	GET /api/v1/cart
Add cart item	POST /api/v1/cart/items
Order creation	POST /api/v1/orders
Customer orders	GET /api/v1/orders/my
Admin orders	GET /api/v1/admin/orders
Payment submission	POST /api/v1/orders/:id/payment-submission
Payment verification	PATCH /api/v1/admin/payments/:id/verify
Payment rejection	PATCH /api/v1/admin/payments/:id/reject
Inventory	GET /api/v1/admin/inventory
Inventory adjustment	POST /api/v1/admin/inventory/adjustments
Delivery update	PATCH /api/v1/admin/deliveries/:id
Customer management	GET /api/v1/admin/customers
Promotions	GET /api/v1/promotions
Content page	GET /api/v1/pages/:slug

All administrative routes must enforce owner authentication and authorization. Validate request payloads, rate-limit sensitive endpoints, and return consistent error responses.

16. Security Requirements

- HTTPS for all production traffic.
- Secure password hashing and session handling.
- OTP expiration, attempt limits, and rate limiting.
- Protection against brute-force login attempts.
- Backend authorization on every administrative operation.
- Input validation and output encoding.
- Secure file upload validation and restricted evidence access.
- Audit logs for payment verification and sensitive owner actions.
- Concurrency-safe inventory operations.
- Database backups and tested restoration procedures.

- Environment-based secrets management.
- Protection against common web application vulnerabilities.
- Review applicable Indian data protection and consumer protection requirements.

17. Non-Functional Requirements

17.1 Performance

- Optimize mobile-first loading and responsive image delivery.
- Paginate product listings and index database queries.
- Optimize API payloads and checkout operations.
- Target Largest Contentful Paint ≤ 2.5 seconds at the 75th percentile.
- Target Interaction to Next Paint ≤ 200 ms at the 75th percentile.
- Target Cumulative Layout Shift ≤ 0.1.
- Target standard API read p95 below 500 ms under an agreed test load.

17.2 Scalability and Reliability

- Support growth in product count, customers, orders, and concurrent sessions.
- Schedule database backups and test restoration.
- Log application errors and important business events.
- Provide recoverable payment verification workflows and safe inventory updates.

17.3 Compatibility and SEO

- Support current Chrome, Edge, Firefox, Safari, and Android mobile browsers.
- Provide product metadata, sitemap, robots.txt, canonical URLs, and product structured data.

18. Notifications

The system should support notifications for registration, OTP delivery, order creation, payment submission, payment verification/rejection, order processing, dispatch, delivery, and cancellation.

Channels may include SMS, email, and WhatsApp. Provider selection, templates, consent, and operating costs require approval before integration.

19. Analytics and Reporting

- Total orders and orders by status.
- Verified payment totals and pending verification.
- Cancelled orders and refunds.
- Product sales and best-selling products.
- Customer registrations.
- Low-stock products and inventory adjustment history.

Sales reporting must use verified payment records and separately account for refunds and cancellations.

20. Acceptance Criteria

20.1 Customer Acceptance

- Mobile OTP registration/login works with configured provider.
- Email/password registration and login work securely.
- Customers can browse, search, and filter products.
- Customers can manage cart and place orders.

- Customers can submit bank/UPI references and view verification status.
- Customers can view order history and manually updated delivery status.

20.2 Owner Acceptance

- Only the configured owner account can access the admin dashboard.
- Owner can manage products, categories, and inventory.
- Owner can view and manage customers and orders.
- Owner can verify or reject payment submissions.
- Owner can update order and delivery statuses.
- Owner can manage banners, featured products, and content pages.

20.3 Data Integrity

- Order details remain intact after product archival or edits.
- Payment verification decisions are auditable.
- Customers cannot verify their own payments.
- Concurrent checkout cannot oversell inventory.
- Payment, order, delivery, and inventory states remain separate.

20.4 Operational Independence

The owner can manage the product catalogue, categories, inventory, payment verification, orders, delivery statuses, promotions, and editable website content without developer intervention.

21. Development and Implementation Plan

Phase	Scope and key tasks	Deliverables
1. Requirements and UI/UX	Finalize branding, user journeys, owner workflows, mobile-first screens, checkout and payment flows; approve wireframes.	Approved designs, user flows, functional specifications.
2. Backend foundation	Initialize backend and MongoDB; implement schemas, owner authentication, customer email/password, OTP integration, authorization, and audit logging.	Backend foundation, authentication, database models.
3. Catalogue	Build product/category APIs, image upload, variants, SKU validation, publication workflow, search/filter, and catalogue pages.	Dynamic catalogue and owner product management.
4. Inventory	Implement reservations, automatic updates, manual adjustments, low-stock alerts, movement history, and concurrency protection.	Hybrid inventory module and dashboard.
5. Customer storefront	Build home, category, listing, detail, search, authentication, profile, address book, and cart.	Complete customer shopping interface.
6. Checkout and payment	Implement checkout, order creation, configurable bank/UPI instructions, UTR submission, evidence upload, owner verification/rejection, and payment history.	Manual payment workflow.
7. Orders and delivery	Implement order dashboard, state transitions, cancellation handling, manual delivery coordination, customer tracking, and history.	Order and manual delivery modules.
8. Admin and CMS	Implement dashboard metrics, customer management, promotions, editable pages, and reports.	Complete owner portal.
9. Testing and security	Test authentication, OTP, payment, inventory concurrency, order lifecycle, responsiveness, authorization, uploads, and performance; resolve defects.	Tested acceptance build and security validation.
10. Deployment	Configure production environment, domain/DNS, frontend/backend, database, storage, SMS, payment instructions, backups, owner account, and training.	Live website, owner dashboard, deployment and admin documentation.

22. Project Dependencies and Client Inputs

Requirement	Responsible party
Store logo and branding	Client
Business address	Client
Business contact number and official email	Client
Product information, images, SKU, pricing, and stock	Client
UPI ID, bank details, and payment recipient name	Client
OTP/SMS provider approval and account	Client / Development team
Delivery, refund, cancellation, and shipping policies	Client
Tax and invoice requirements	Client / Accountant
Domain and hosting access/approval	Client

23. Open Decisions

ID	Decision	Status
D-01	Integrated payment gateway	Not required for initial release
D-02	Bank/UPI payment details	Awaiting client information
D-03	Courier integration	Not required for initial release
D-04	OTP/SMS provider	To be selected
D-05	Inventory reservation expiry	To be finalized
D-06	Cancellation eligibility	To be finalized
D-07	Refund processing policy	To be finalized
D-08	Delivery charges	To be finalized
D-09	Tax and invoice requirements	To be finalized
D-10	Notification channels	To be finalized
D-11	Wishlist	Scope approval required
D-12	PWA installation	Scope approval required
D-13	Supported delivery regions	Awaiting client information

24. Risk Management

Risk	Mitigation
Incorrect payment claims	Require owner verification against actual bank/UPI transaction.
Fake payment screenshots	Treat screenshots as supporting evidence only.
OTP abuse	Use expiry, attempt limits, and rate limiting.
Overselling	Use atomic/concurrency-safe stock reservation.
Manual delivery delays	Maintain clear order and delivery statuses.
Incorrect stock quantities	Maintain inventory adjustment logs.
Accidental product deletion	Use soft deletion and immutable order snapshots.
Unauthorized admin access	Use single-owner authentication and backend authorization.
Incomplete legal policies	Obtain client approval before launch.

25. Future Enhancements

- Integrated payment gateway.
- Courier API integration and automated delivery tracking.
- WhatsApp notifications.
- Product reviews and customer wishlist.
- Coupon management and loyalty programme.
- Native Android and iOS applications.
- Advanced analytics and multi-warehouse inventory.
- Invoice generation and advanced marketing tools.

26. Final Product Definition

Satya Stores will be a custom-built, mobile-first e-commerce platform with a customer storefront and a single-owner administration portal.

- Customer storefront: dual authentication, catalogue browsing, search, cart, checkout, manual bank/UPI payment submission, order history, and delivery status.
- Owner portal: product/category management, hybrid inventory, customer management, order management, manual payment verification, manual delivery coordination, promotions, content management, and reporting.

Both interfaces must use a consistent backend and database. The owner must be able to operate the store independently for routine business activities. Payment, order, delivery, and inventory state transitions must be independently controlled and auditable.

27. Approval and Sign-Off

Stakeholder	Name	Status
Business owner	Vasavi Enterprises representative	Pending
Development partner	TECKSODO Solutions	Pending
Technical lead	To be assigned	Pending

Document version: 1.1 | Status: Updated based on confirmed client decisions. Implementation is pending approval of remaining open decisions and receipt of required business information.
